Mumps Cases Reported in Pittsburg, Kansas

Pittsburg, Kan. – Area health professionals are investigating five cases of mumps in Pittsburg. Onsets of illness occurred in early February. Information is subject to change as investigations continue.

According to the Centers for Disease Control and Prevention (CDC), more than 4,000 mumps cases were reported in the U.S. in 2016, and mumps outbreaks are ongoing in the nearby states of Missouri, Oklahoma and Arkansas.

Mumps is a contagious disease caused by a virus. Mumps typically starts with a few days of fever, headache, muscle aches, tiredness and loss of appetite, followed by swollen salivary glands. Mumps can occasionally cause complications, including inflammation of the testicles or ovaries, meningitis or encephalitis. Most people with mumps recover completely in a few weeks.

Anybody with symptoms of mumps should isolate themselves and call their healthcare provider. People who are concerned they may have mumps should call the Crawford County Health Department (620-231-5411). Anybody who suspects they may have mumps should contact their healthcare provider immediately and stay home from work, school, and any social activities.

People with mumps can spread the disease before the salivary glands begin to swell and up to five days after the swelling begins. Mumps spreads through saliva or mucus from the mouth, nose or throat. An infected person can spread the virus through the following:

- Coughing, sneezing or talking.
- Sharing items, such as cups or eating utensils, with others.
- Touching objects or surfaces with unwashed hands that are then touched by others.

In addition to staying isolated when you have mumps, you can help prevent the virus from spreading by:

- Covering your mouth and nose with a tissue when you cough or sneeze, and put your used tissue in the trash can. If you don't have a tissue, cough or sneeze into your upper sleeve or elbow, not your hands.
- Washing your hands often with soap and water for at least 15 seconds.
- Avoiding sharing drinks or eating utensils.
- Disinfecting frequently touched surfaces, such as toys, doorknobs, tables, counters.

"Working towards healthy people living in healthy communities"

After the introduction of the MMR (measles, mumps, and rubella) vaccine, mumps became less common in the United States. MMR vaccine prevents most, but not all, cases of mumps and complications caused by the disease. Some people who receive two doses of MMR can still get mumps, especially if they have prolonged, close contact with someone who has the disease. If a vaccinated person does get mumps, they will likely have less severe illness than an unvaccinated person. Therefore, the best way to reduce your chance of getting the disease is by being vaccinated with the MMR vaccine.
